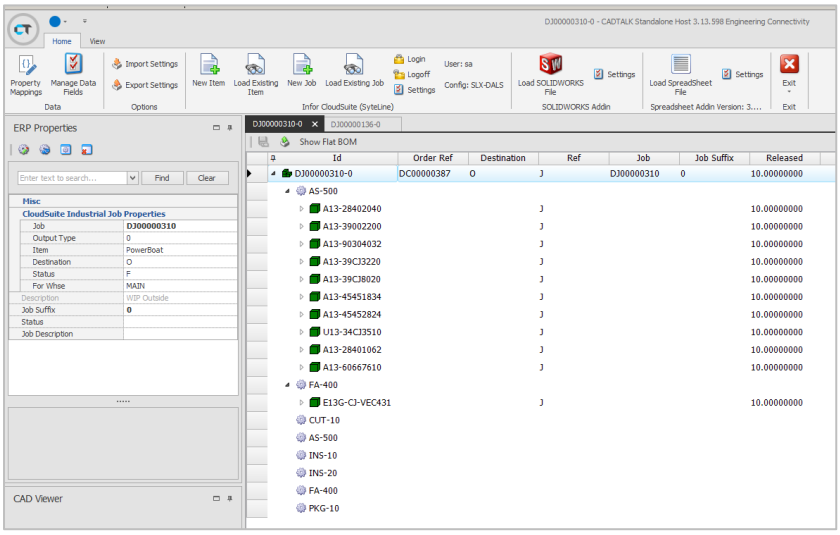
100,000+ Bill of Materials Processed Per Year with CADTalk. That number is growing every year.

CADTALK
Integrate Intelligently℠

Manage Engineering Changes for Open & In Process Jobs (Work Orders)

JOBS



Workbench for Revisions to Open Jobs (Work Orders)

CADTALK JOBS is a workbench providing all of the information engineers and manufacturing professionals need to make critical decisions on how to implement engineering revisions for open and/or in process work orders or jobs.

An engineering revision is made in your CAD system. Do you simply update the item master file, the bill of materials and the routing or do you need to update this information for open production jobs and how do you make those determinations when some jobs are already in process and may be well beyond the manufacturing processes affected by the revision?

Answer – you need CADTALK JOBS. The workbench provides the engineer or manufacturing operations team with all the details related to the engineering changes. It also shows the information from the ERP system including affected items, bills of material, and routings. And then it also shows all of the open production jobs (work orders or manufacturing orders) with details on the manufacturing process.

The engineer can then decide which jobs to update with the new revision and can quickly identify which jobs may require rework or may need to be cancelled to comply with critical engineering revisions that must be implemented immediately. The engineer can even create new jobs from the work bench in the ERP system.

Without CADTALK JOBS your engineers are forced to work between systems trying to piece together information to determine what to do. With CADTALK JOBS they have all the information they need and can implement changes from the workbench directly to the open jobs or work orders in the ERP system.

CADTALK JOBS is currently available for Infor CloudSuite Industrial (SyteLine). Contact us for availability for your ERP business application.

Key Benefits

- Update in-process manufacturing jobs with item, bill of material, and routing changes from your CAD system
- Access CAD bill of material and design information, ERP data, and open Jobs in a single application
- Understand which jobs can be changed and make the changes to the ERP jobs directly from the workbench
- Cancel jobs and create new jobs based on the engineering revisions when jobs have not started or otherwise can be adjusted without requiring rework
- Save time and avoid confusion working in a single platform
